

Scatterometer winds at Météo-France: usage and new datasets

Christophe Payan, Vincent Chabot ⁽¹⁾, David Barbary ⁽²⁾

⁽¹⁾ CNRM and GAME, Météo-France and CNRS

⁽²⁾ LACy, La Réunion University, CNRS and Météo-France

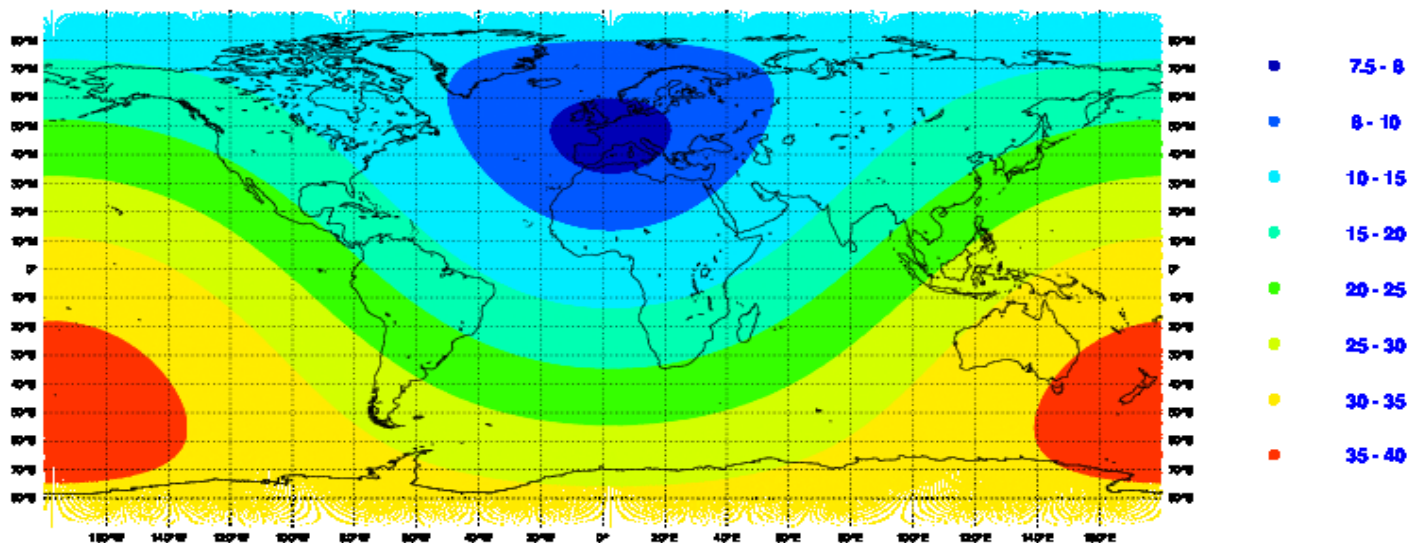

Outline

- Model update (global) and scatterometer winds use
- Impact of scatterometer winds in the ensemble assimilation
- RapidSCAT (ISS) and HSCAT (HY-2A) winds, 50km product, EUMETSAT OSI SAF L2B processing (KNMI)

Global model ARPEGE update (April 2015)

Main features of the last version switched operational in April 2015:

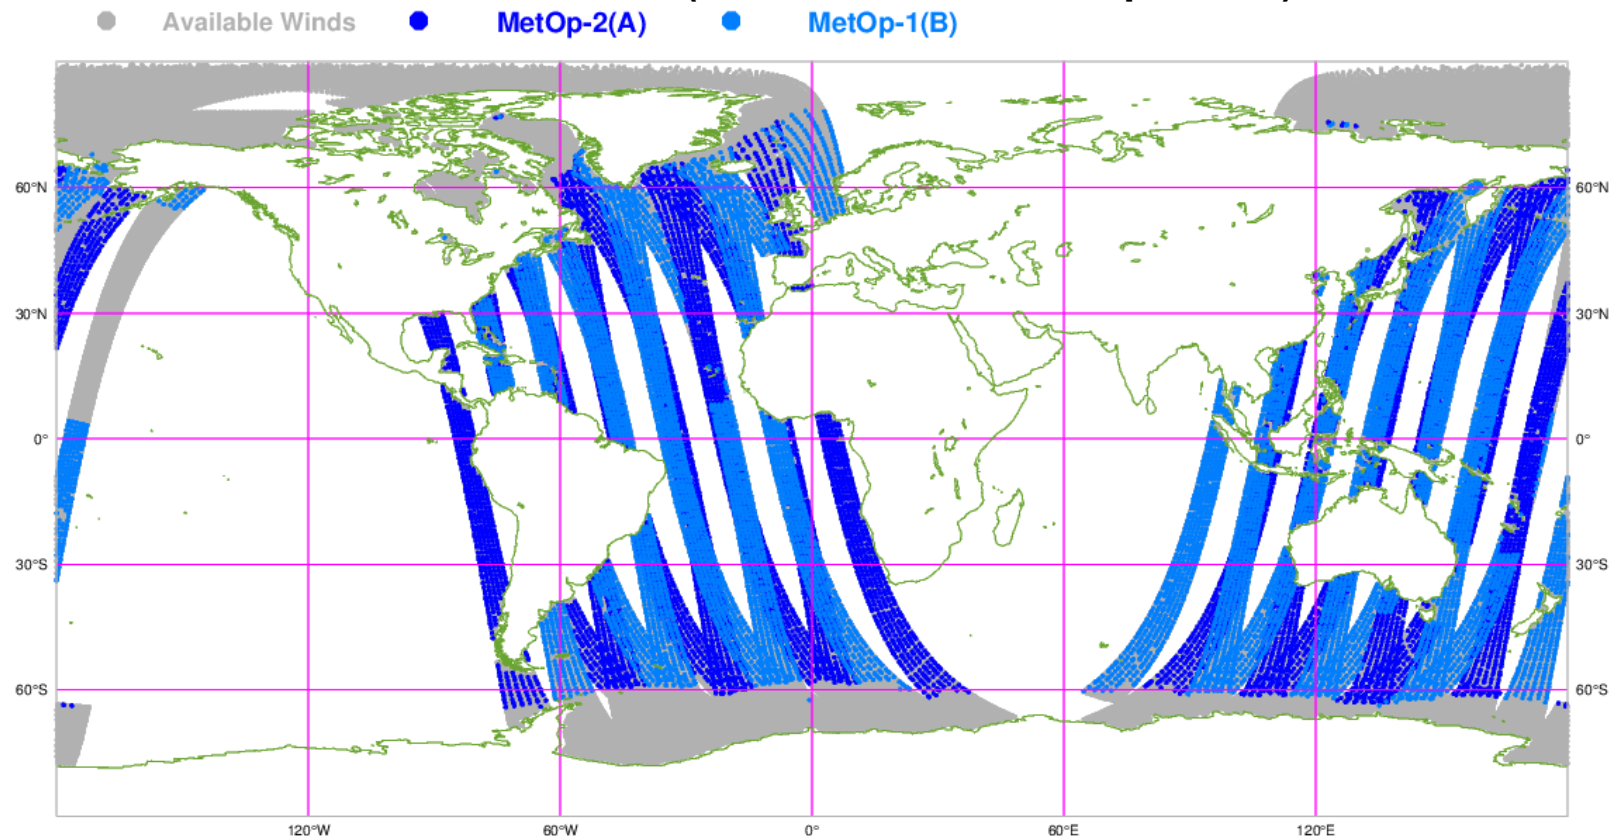

- Resolution: T1198c2.2 (between 7.5 and 36km), L105 (~10m to 0.1 hPa)
- Assimilation: 4D-Var, 6 hours window, 30' timeslots, with 2 inner loops (40 + 40 iterations), T149 (~135km) and T399 (~50km)
- Background variances given by AEARP, 25 members, T479 L105 (~40km), 1 inner loop T149L105, 1.5 day average for covariances, update every 6 hours

ARPEGE resolution T1198C2.2 in km

Scatterometer winds use on 6 hours

After the OSCAT loss in February 2014, only ASCAT instruments (A&B) available for the assimilation (EUMETSAT OSI SAF product)

Scatterometer winds **available**

Data assimilated: ■ ASCAT-A, **operational** since Feb 2008

■ ASCAT-B, **operational** since July 2013

Scatterometer winds use

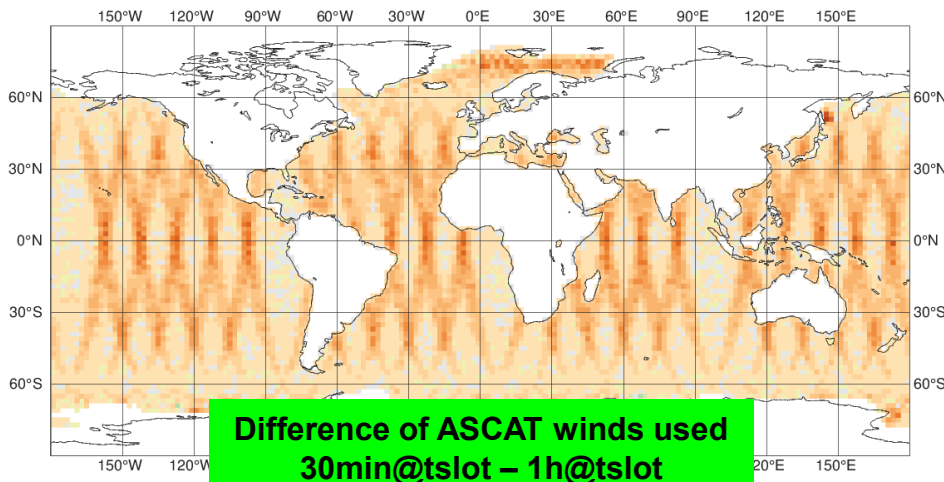

ASCAT-B from EARS service used

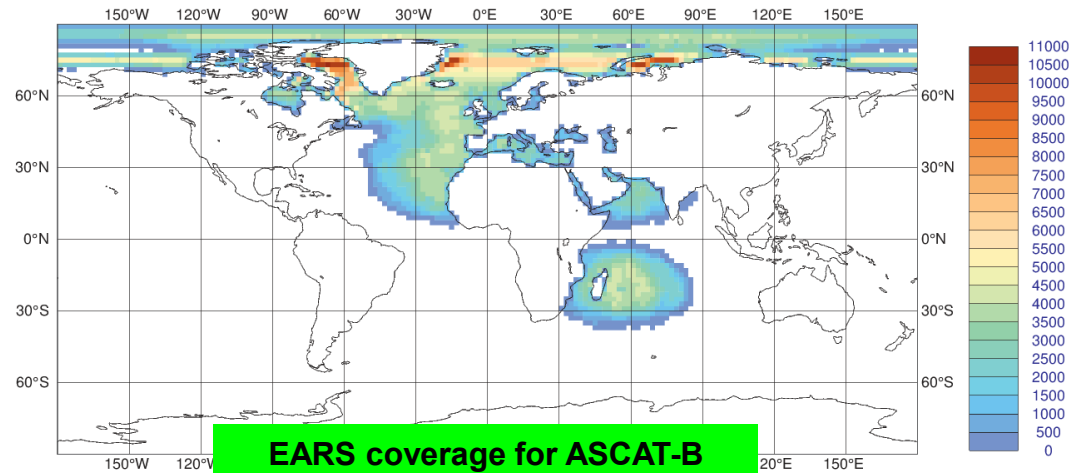

Timeliness of around 30 min, instead of 1 hour for the global stream (ADA service).

Number of observations from ASCAT-A&B
Used data [time step = 6 hours]
All_surfaces, Area =global
DBLE minus OPER, Data period = 2015-03-01 00:00 - 2015-03-31 18:00
Grid : 2.00 x 2.00 / Min: -27 Max: 88 Mean: 12

Number of observations from MetOp-B/ASCAT EARS
Best ambiguous wind, All data [time step = 6 hours]
All_surfaces, Area =global
Exp = DBLE, Data period = 2015-03-01 00:00 - 2015-03-31 18:00
Grid : 2.00 x 2.00 / Min: 0 Max: 10513 Mean: 3770

Timeslots of 30 min instead of 1 hour

More assimilated data towards the equator where ASCAT swaths overlap and separated only by 50 min, +5% globally.

Scatterometer winds impact, ensemble assimilation AEARP

Var(analysis)/Var(background) mean, AEARP EXP=6951, 25 members
Par=RelVorticity105 ~1010hPa, AnValid=20131201H06-20131201H06, Step=6, 1 case
min=0.37 max=1.23 mean=0.89

ASCAT-A & B, OSCAT missing

Var(analysis)/Var(background) mean, AEARP EXP=6951, 25 members
Par=RelVorticity105 ~1010hPa, AnValid=20131204H06-20131204H06, Step=6, 1 case
min=0.35 max=1.1 mean=0.87

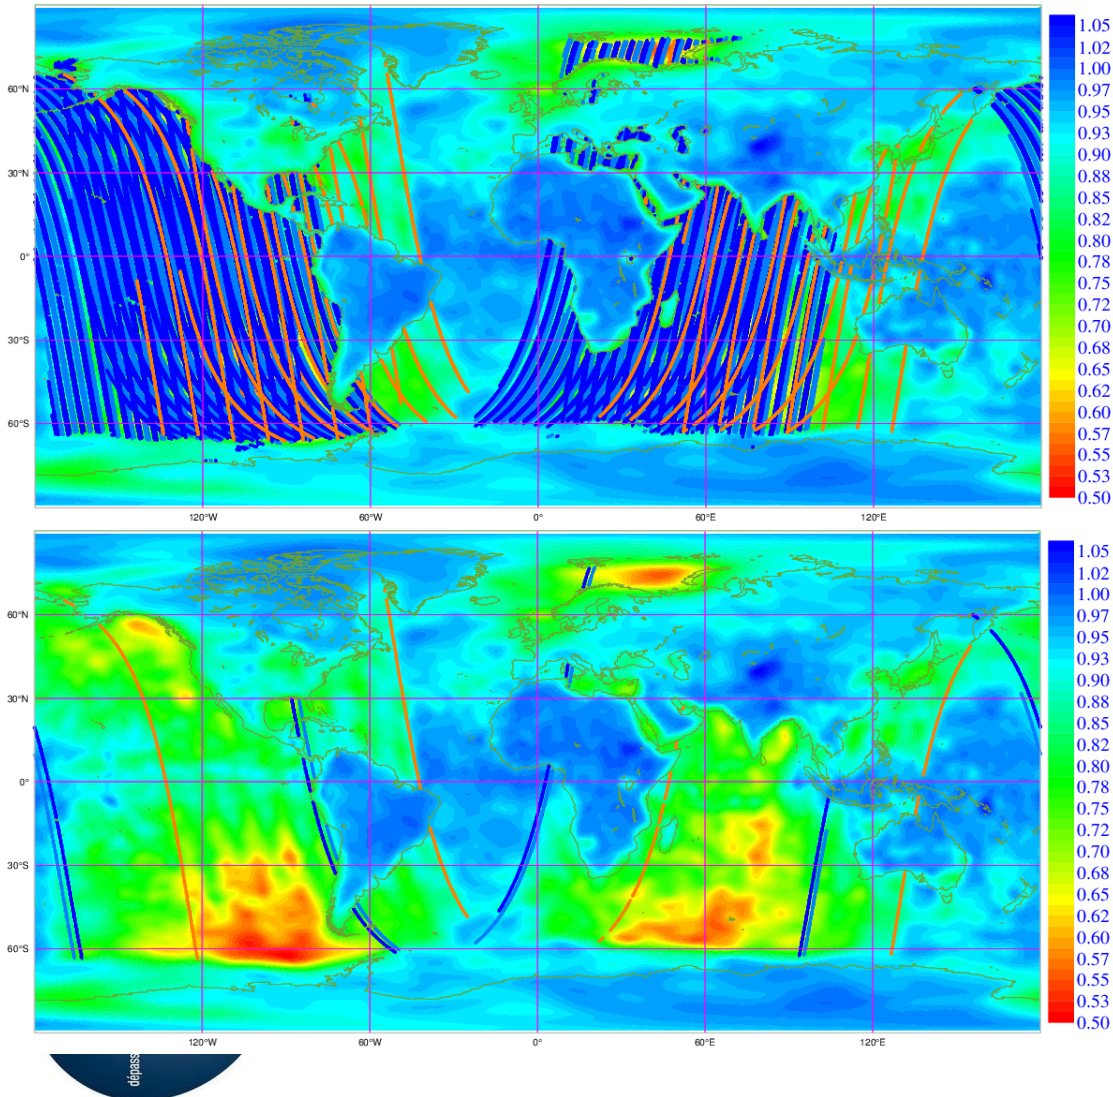

Same thing 3 days later, **OSCAT** is back

Error variance reduction (σ_a^2/σ_b^2) for relative vorticity at 10 m

- Correlated to scatterometer swaths over oceans (winds present)

Scatterometer winds impact, ensemble assimilation AEARP

Var(analysis)/Var(background) mean, AEARP EXP=6951, 25 members
Par=RelVorticity105 ~10m, AnValid=20131203H06-20131212H06, Step=24, 10 cases
min=0.5 max=1.05 mean=0.87

- ASCAT-A & B, OSCAT ground tracks of the swath edges (right/left) for the 6 UTC assimilation run (on 10 days)
- ~40 orbits by platform are represented, the OSCAT frame is looser because the orbit repeats every 2 days (~5 orbits by orange line)
- Same data, but only the extreme swath edges for each satellite on the period are plotted
- Overlarge areas of variance reduction when the swaths of ASCAT-A and ASCAT-B separate and with OSCAT overlaps

Scatterometer winds impact, ensemble assimilation AEARP

Var(analysis)/Var(background) mean, AEARP EXP=6951, 25 members
Par=RelVorticity105 ~10m, AnValid=20131203H12-20131212H12, Step=24, 10 cases
min=0.49 max=1.03 mean=0.86

- Scatterometer winds impact also the north hemisphere but at 12 UTC (as here) and 0 UTC

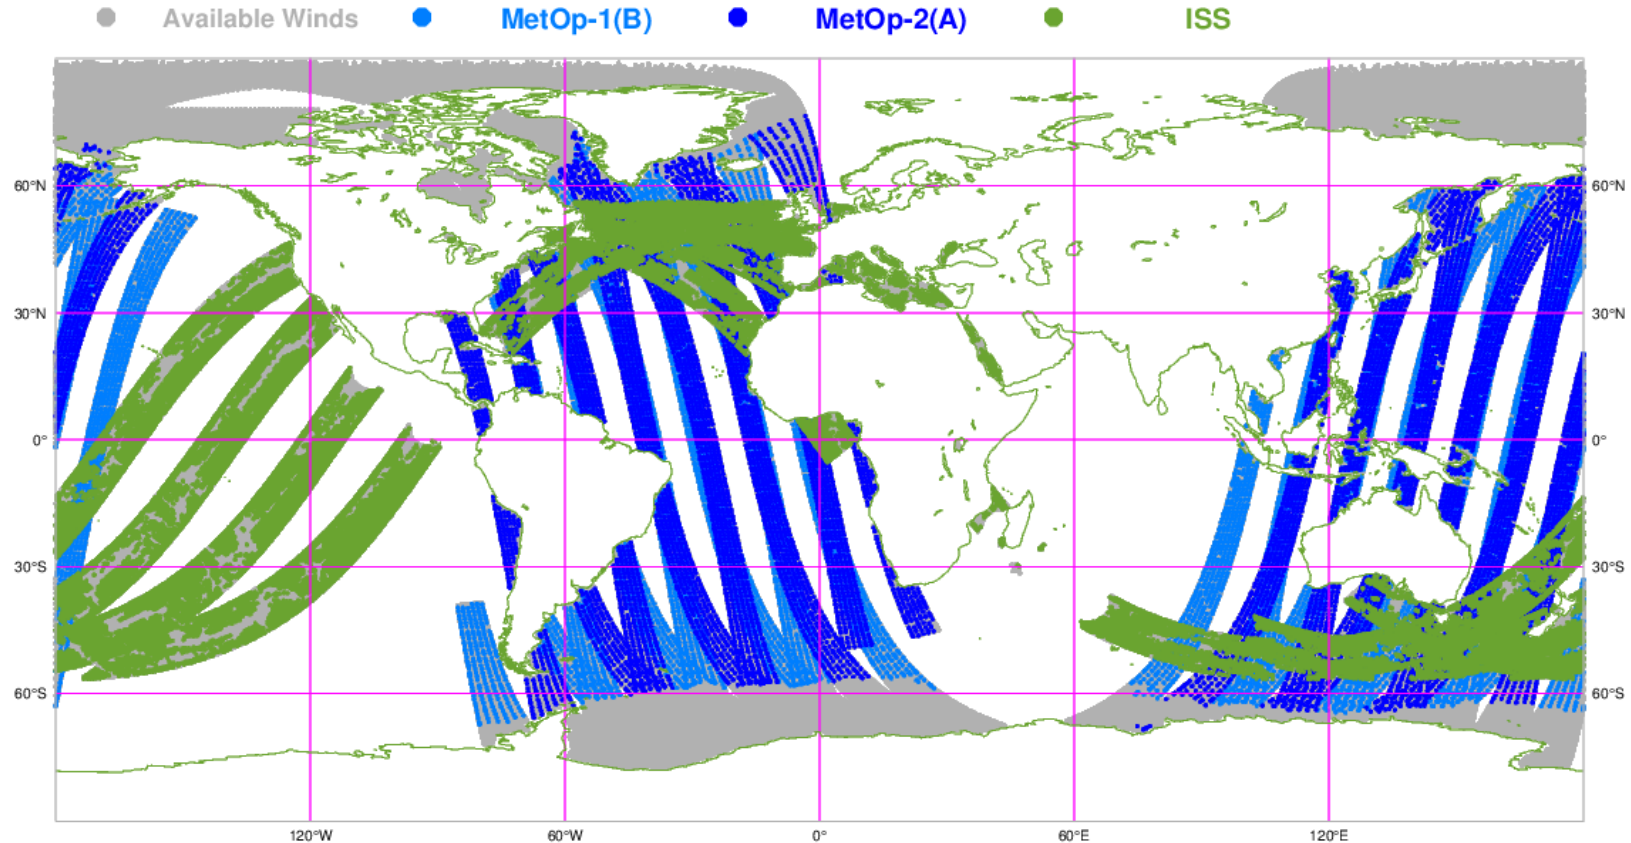

- Same data, but only the extreme swath edges for each satellite on the period are plotted
- Overlarge areas of variance reduction when the swaths of ASCAT-A and ASCAT-B separate and with OSCAT overlaps

METEO FRANCE

RapidSCAT (ISS) from the OSI-SAF (KNMI) on 6 hours

SCAT winds coverage, by satellite
Arpege-Test, assimilation run 10/12/2014, 0 UTC

Scatterometer winds **available**

Data assimilated:

- ASCAT-A
- ASCAT-B

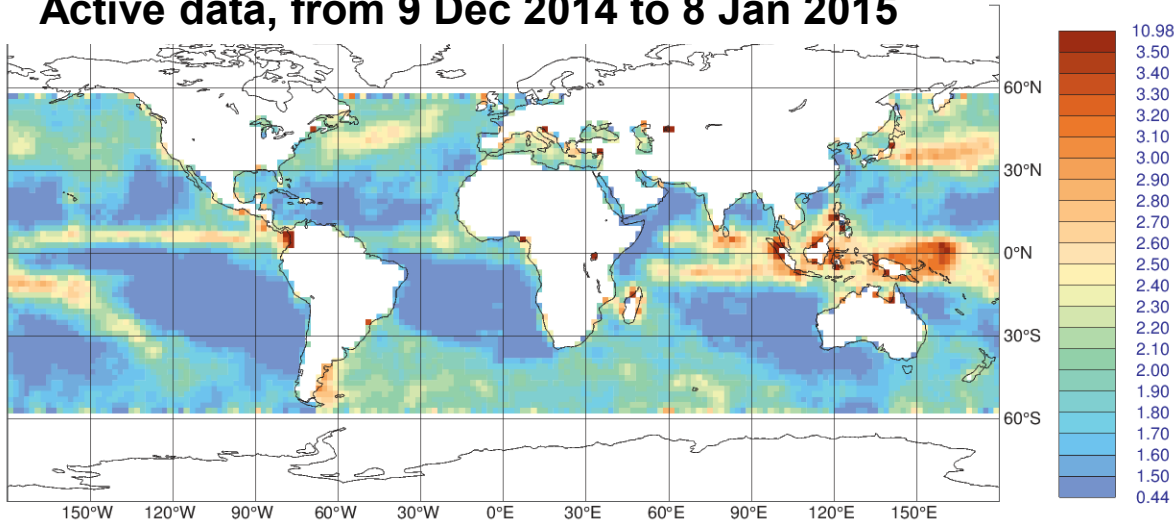

QC success:

■ **RapidSCAT:** ftp dissemination started in Dec 2014 (test), operational status since March 2015, available on EUMETCAST since yesterday!

For access, contact the KNMI OSI SAF team.

50km RapidSCAT winds

RapidSCAT winds RMSVD to model background Active data, from 9 Dec 2014 to 8 Jan 2015

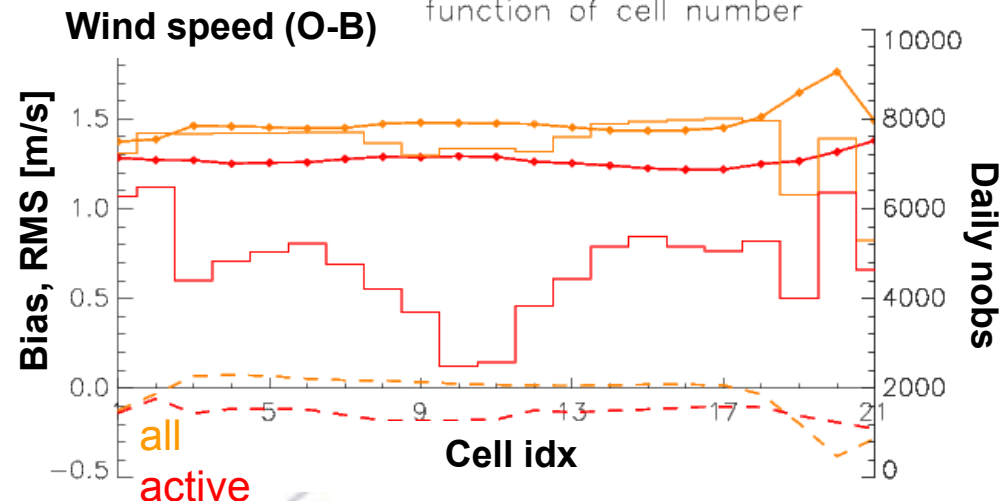

- RMSVD to model bkgrd similar to ASCAT statistics (after quality control, mainly rain effect removal)
- Highest differences along the ITCZ the Gulf Stream and the Kuroshio
- On average, RapidSCAT RMSVD is close to 1.8 m.s^{-1} , 13° for direction RMS, 1.3 m.s^{-1} in speed

Statistics along the cross-track index show:

- a speed bias of -0.14 m.s^{-1} (after QC)
- ISS solar panels effect removed after QC (on the right side of the swath)
- rejection rate by the QC around 35%, as with OSCAT

RAPIDSCAT/ISS winds, Globe, 20141209 to 20150108
all data — active data
function of cell number

RapidSCAT assimilation, 3 tests (t1), (t2) and (t3) 33 forecasts at 0 UTC, from 10/12/2014 to 11/01/2015

Normalized RMS scores / radiosondes [%]:

— Improvement - - - Degradation - - - Neutral impact ■ Significance at 99 % (bootstrap)

t1: as OSCAT

NORTH20 – Z score

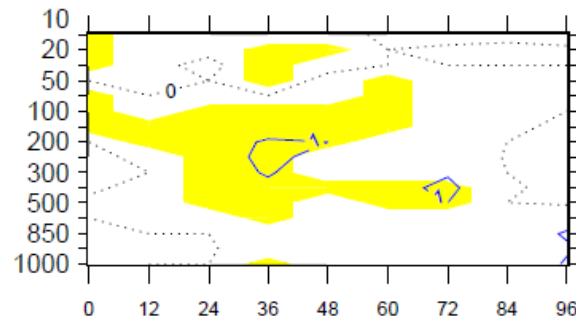

TROPICS – Wind score

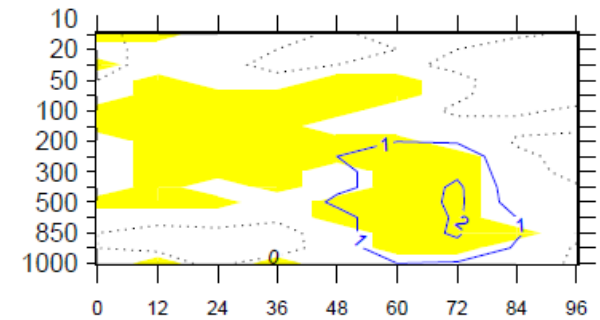

SOUTH20 – Z score

t2: (t1) +25m/s W.Spnd thld.

t3: (t2) +100km thinning

Forecast range [hour]

RapidSCAT assimilation as OSCAT

47 forecasts at 0 UTC, from 10/12/2014 to 25/01/2015

Tropical Cyclones forecast scores* / best tracks:

*provided by the LACy (Réunion Island)

Nb of forecast by range

Position error

- Position error improvement at all fc-range.

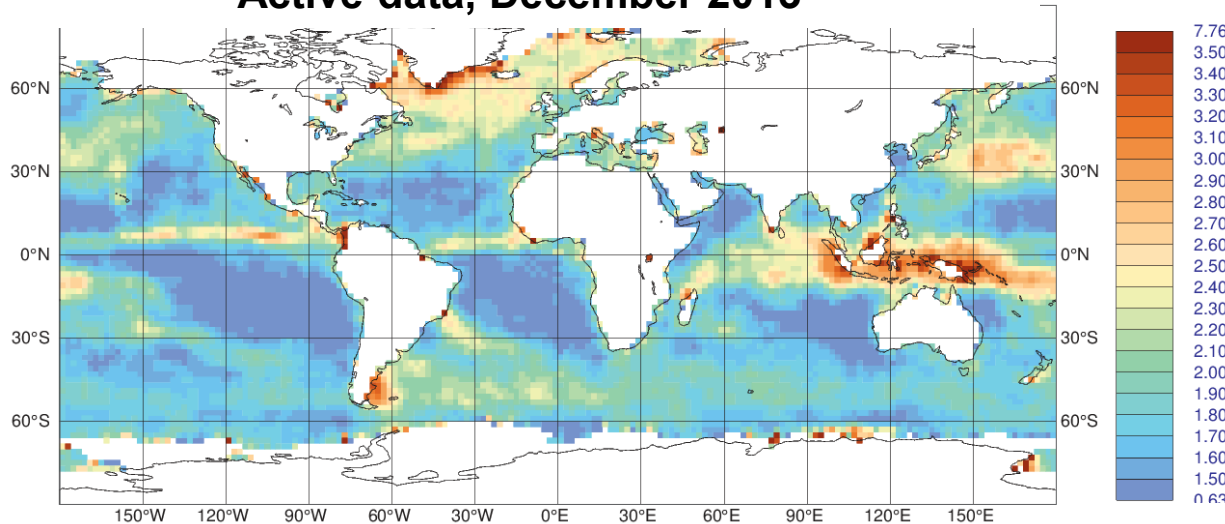

Wind max error

- Wind max error: degradation beyond 3 days, mainly in standard deviation, light improvement before.

50km HSCAT (HY-2A), off-line dataset in Dec 2013

HSCAT winds RMSVD to model background Active data, December 2013

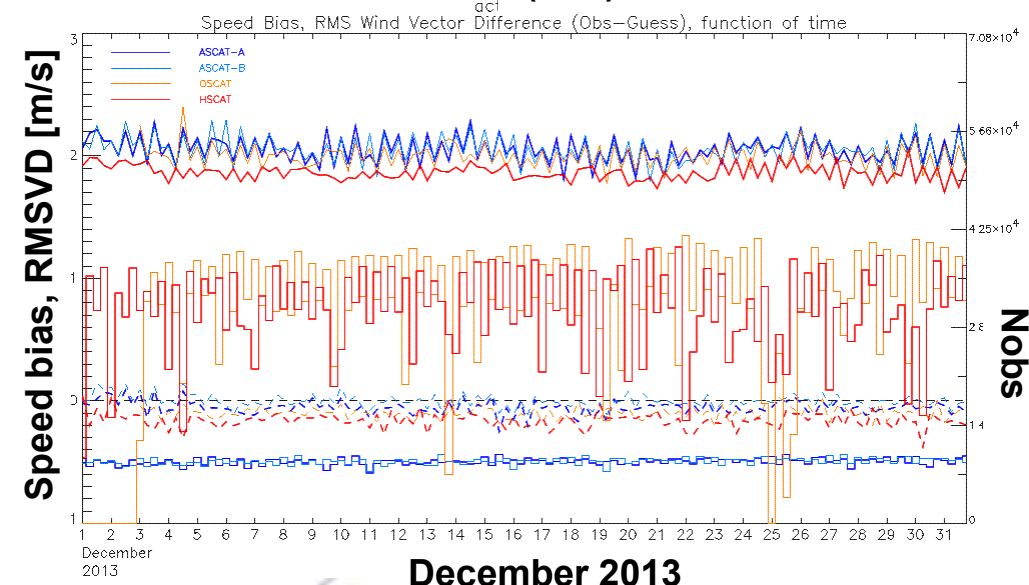

- RMSVD to model bkgrd similar to statistics with other instruments (after quality control)
- On average, HSCAT RMSVD is close to 1.9 m.s^{-1} , 13° for direction RMS, 1.3 m.s^{-1} in speed

Statistics by assimilation run on Dec 2013 show:

- HSCAT RMSVD slightly lower than ASCAT and OSCAT
- a speed bias (-0.16 m.s^{-1}) slightly more negative (coming from the southern hemisphere)

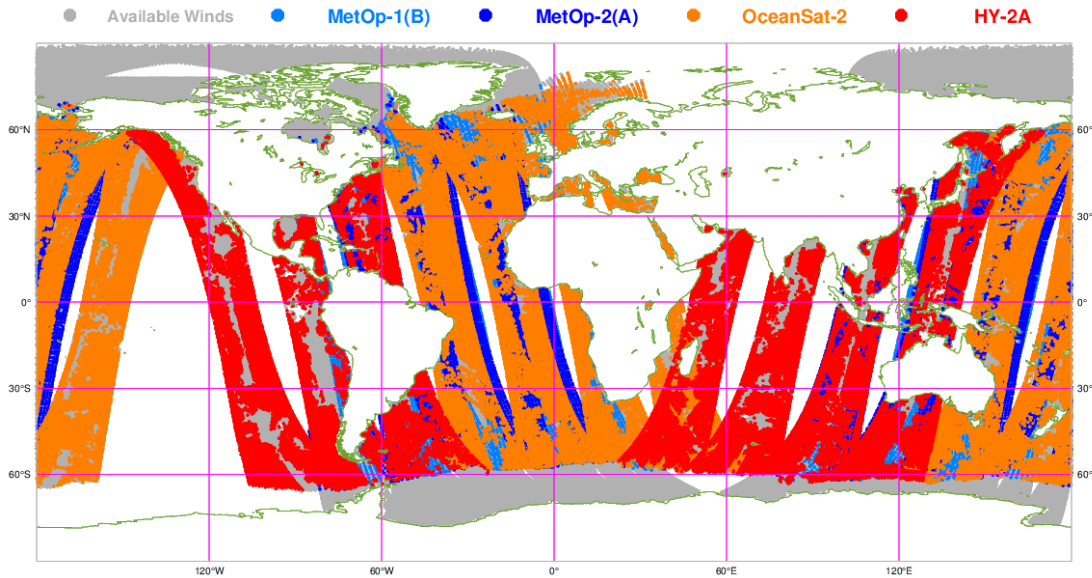

(O-B) statistics after QC

HSCAT winds coverage on 6 hours

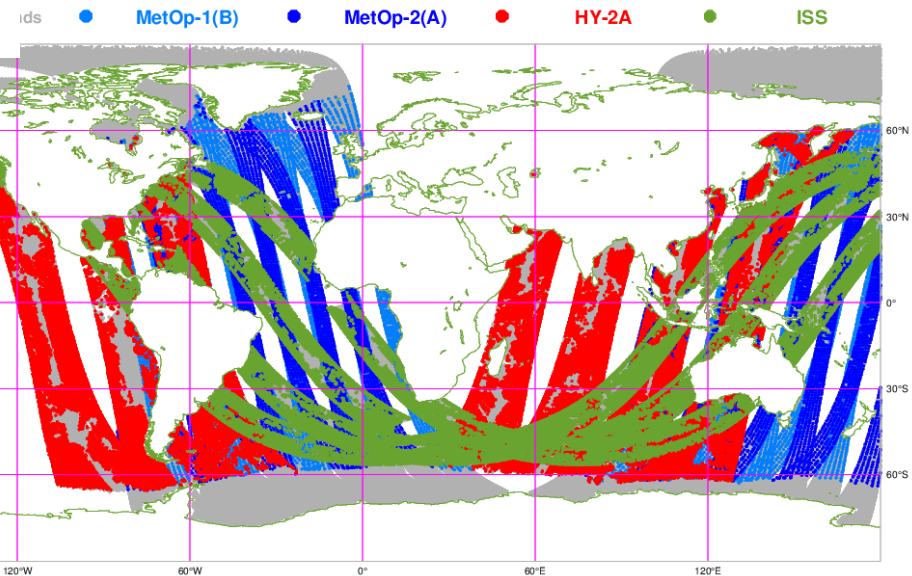

Scatterometer winds coverage, by satellite
Arpege-Test, assimilation run 05/12/2013, 0 UTC

Scatterometer winds coverage before the loss of OSCAT, and with HSCAT added (for a 6 hours assimilation window, centred here on 0 UTC, December 2013)

Current virtual constellation of scatterometer winds, if ASCATs, HSCAT and RapidSCAT were used all together

Scatterometer winds virtual-coverage, by satellite
Arpege-Test, assimilation run, 0 UTC

HSCAT assimilation, test « as OSCAT »

31 forecasts at 0 UTC, December 2013

Normalized RMS Z scores [%]:

— Improvement - - - Degradation - - - Neutral impact ■ Significance at 99 % (bootstrap)

/radiosondes

/IFS analysis

/own analysis

NORTH20

TROPICS

SOUTH20

Forecast range [hour]

HSCAT assimilation, « as OSCAT »

31 forecasts at 0 UTC, December 2013

Tropical Cyclones forecast scores* / best tracks:

*provided by the LACy (Réunion Island)

Nb of forecast by range

Position error

- Position error: light improvement at the end of validity

Wind max error

- Wind max error: prominent improvement of biases.

Conclusions

- Only the ASCAT winds are used operationally currently
- Scatterometer winds control the dispersion, over the oceanic surfaces, of the ensemble assimilation used for updating the B-matrix for the deterministic run
- The new wind datasets from RapidSCAT and HSCAT have a good quality, similar to ASCAT or OSCAT winds, even a bit better
- These new winds improve the tracking of tropical cyclones. The global scores are more mixed. RapidSCAT winds might be used in our next operational configuration (for the end of the year?), depending on the results of the current work
- Adequate timeliness remains required for HSCAT on HY-2A
